ng add

Adds support for an external library to your project.

ng add <collection> [options]

DOCS

Description

>

Adds the npm package for a published library to your workspace, and configures the project in the current working directory (or the default project if you are not in a project directory) to use that library, as specified by the library's schematic. For example, adding @angular/pwa configures your project for PWA support:

ng add @angular/pwa

The default project is the value of defaultProject in angular.json.

Arguments

ARGUMENT	DESCRIPTION
<collection></collection>	The package to be added.

Options

OPTION	DESCRIPTION
defaults=true false	When true, disables interactive input prompts for options with a default.
help= true false json JSON	Shows a help message for this command in the console. Default: false
interactive=true false	When false, disables interactive input prompts.
registry= <i>registry</i>	The NPM registry to use.
verbose=true false	Display additional details about internal operations during execution. Default: false
