[CLI](#)

ng deploy

Invokes the deploy builder for a specified project or for the default project in the workspace.

ng **deploy** *<project>* [*options*]

Description

The command takes an optional project name, as specified in the `projects` section of the `angular.json` workspace configuration file. When a project name is not supplied, executes the `deploy` builder for the default project.

To use the `ng deploy` command, use `ng add` to add a package that implements deployment capabilities to your favorite platform. Adding the package automatically updates your workspace configuration, adding a deployment [CLI builder](#). For example:

```json
"projects": {
    "my-project": {
        ...
        "architect": {
            ...
            "deploy": {
                "builder": "@angular/fire:deploy",
                "options": {}
            }
        }
    }
}
```

Arguments

ARGUMENT	DESCRIPTION
<project>	The name of the project to deploy.

Options

OPTION	DESCRIPTION
--configuration=*configuration*	A named build target, as specified in the "configurations" section of angular.json. Each named target is accompanied by a configuration of option defaults for that target. Aliases: -c
--help= true|false|json|JSON	Shows a help message for this command in the console. Default: false
